Thermal neutron scattering — probing the structral dynamics of condensed matter at the atomic scale

J. Chadwick B.N. Brockhouse C.G. Shull E. Wollan

E. Fermi

Scattering theory

$$\frac{d^2\sigma}{d\Omega d\omega} = \frac{|\mathbf{k}|}{|k_0|} S(q,\omega)$$

Differential scattering cross section

$$|\Psi^{(+)}\rangle = |\Psi^{(0)}\rangle + \frac{\hat{\mathbf{1}}}{E - \hat{\mathbf{H}}_n - \hat{\mathbf{H}}_t + i\epsilon} \hat{\mathbf{V}}|\Psi^{(+)}\rangle$$

$$\hbar \mathbf{q} = \mathbf{p}_0 - \mathbf{p}$$
$$\hbar \omega = \frac{|\mathbf{p}_0|^2}{2m} - \frac{|\mathbf{p}|^2}{2m}$$

Momentum and Energy transfer

G.C. Wick

L. Van Hove

Interpretation

Fermi pseudopotential

 $V(\mathbf{r}) = \frac{2\pi\hbar^2}{m} \sum_{i} b_i \delta(\mathbf{r} - \hat{\mathbf{R}}_i)$

$$\ll \lambda_n$$

Lippmann-Schwinger equation

Dynamic structure factor

Intermediate scattering function

$$F(\mathbf{q},t) = \frac{1}{N} \sum_{j,k} \Gamma_{jk} \left\langle e^{-i\mathbf{q}\cdot\hat{\mathbf{R}}_{j}(0)} e^{i\mathbf{q}\cdot\mathbf{l}} \right\rangle$$

$$\Gamma_{jk} = \overline{b_j}^* \overline{b_k} + \delta_{jk} \overline{|b_j - \overline{b_j}|^2}$$

F(q,t) is a quantum time correlation function

Symmetries

$$F^*(\mathbf{q}, t) = F(\mathbf{q}, -t),$$
$$F(\mathbf{q}, -t) = F(-\mathbf{q}, t + i\beta\hbar)$$

Recoil moment

$$\int_{-\infty}^{+\infty} d\omega \, \omega S(\mathbf{q}, \omega) = -i \left. \frac{\partial F(\mathbf{q}, t)}{\partial t} \right|_{t=0} \propto \frac{\hbar |\mathbf{q}|^2}{2m}$$

$$S^{*}(\mathbf{q},\omega) = S(\mathbf{q},\omega),$$
$$S(\mathbf{q},\omega) = e^{\beta\hbar\omega}S(-\mathbf{q},-\omega)$$

Scattering kinematics

Motivation for a spectroscopy-oriented theory of neutron scattering

Time-dependent pair correlation function

PHYSICAL REVIEW

Correlations in Space and Time and Born Approximation Scattering in Systems of Interacting Particles

> Léon Van Hove Institute for Advanced Study, Princeton, New Jersey (Received March 16, 1954)

From (q, ω) -space to (r, t)-space

$$G(\mathbf{r},t) = \frac{1}{(2\pi)^3} \int \int d^3q dt \, e^{i(\omega t - \mathbf{q},\mathbf{r})} S(\mathbf{q})$$
$$= \frac{1}{N} \sum_{j,k} \Gamma_{jk} \int d^3r' \left\langle \delta\left(\mathbf{r} - \mathbf{r}' + \mathbf{r}'\right) \right\rangle$$

$$G_{\rm cl}(\mathbf{r},t) = \frac{1}{N} \sum_{j,k} \Gamma_{jk} \left\langle \delta \left(\mathbf{r} - \left[\mathbf{R}_k(t) - \mathbf{R}_j(0) \right] \right) \right\rangle_{\rm cl}$$

"Kicked Hamiltonian"

$$e^{-\beta\hat{H}}e^{-i\mathbf{q}\cdot\hat{\mathbf{x}}_{1}}\underbrace{e^{it\hat{H}/\hbar}e^{i\mathbf{q}\cdot\hat{\mathbf{x}}_{1}}e^{-it\hat{H}/\hbar}}_{e^{i\mathbf{q}\cdot\hat{\mathbf{x}}_{1}(t)}}\left\}$$

$$e^{-\beta\hat{H}}\underbrace{e^{-i\mathbf{q}\cdot\hat{\mathbf{x}}_{1}}e^{it\hat{H}/\hbar}e^{i\mathbf{q}\cdot\hat{\mathbf{x}}_{1}}}_{e^{it\hat{H}/\hbar}e^{i\mathbf{q}\cdot\hat{\mathbf{x}}_{1}}}e^{-it\hat{H}/\hbar}\right\}$$

Energy landscape-based description of neutron scattering

A wave-mechanical model of incoherent quasielastic scattering in complex systems

Hans Frauenfelder^{a,1}, Paul W. Fenimore^a, and Robert D. Young^b

^aTheoretical Biology and Biophysics Group, Los Alamos National Laboratory, Los Alamos, NM 87545; and ^bCenter for Biological Physics, Arizona State University, Tempe, AZ 85287-1504

PNAS 12764–12768

the system from the initial energy level E to the final level $E+\Delta E$.

X H. Frauenfelder et al, Science 254, 1598 (1991).

September 2, 2014 | vol. 111 | no. 35

During its flight through the sample, the neutron wave packet records the net energy transition of

QENS spectrum composed of many « Mössbauer lines »

- The description is essentially qualitative
- Momentum transfer is not considered

The role of momentum transfer during incoherent neutron scattering is explained by the energy landscape model

Hans Frauenfelder^{a,1}, Robert D. Young^b, and Paul W. Fenimore^{a,1}

• The neutron is considered as a passive probe

PNAS 114, 5130 (2017).

The neutron is an active probe : "Local heating"

of the sample due to the momentum transfer.

But: Momentum and energy transfer are not

connected through scattering kinematics.

Develop a theory of neutron scattering, which

is "spectroscopic", in the sense that the neutron is an active probe, (de)exciting transitions in the scattering system

integrates the concept of energy landscapes, which is adapted for complex systems

"Franck-Condon-interpretation" of neutron scattering

Franck–Condon picture of incoherent neutron scattering

Gerald R. Kneller^{a,b,1}

Use Wick's "kicked" Hamiltonian

$$F_{s}(\mathbf{q},t) = \frac{1}{Z} \sum_{m,n} \langle \phi_{m} | e^{-\beta \hat{H}} | \phi_{n}'(\mathbf{q}) \rangle \langle \phi_{n}'(\mathbf{q}) | e^{it \hat{H}'(\mathbf{q})/\hbar} e^{-it \hat{H}/\hbar} | \phi_{m} \rangle$$
$$= \frac{1}{Z} \sum_{m,n} e^{-\beta E_{m}} e^{i(E_{n}' - E_{m})/\hbar} \left| \langle \phi_{n}'(\mathbf{q}) | \phi_{m} \rangle \right|^{2}$$

 $\hat{H}|\phi_m\rangle = E_m|\phi_m\rangle$ $\hat{H}'(\mathbf{q})|\phi_n'(\mathbf{q})\rangle = E_n'|\phi_n'(\mathbf{q})\rangle$

PNAS, 115, pp. 9450 2018.

probabilities for a scattering-induced transition from the unperturbed energy level m to the perturbed energy level n.

Eigenfunctions and eigenvalues of the kicked Hamiltonian

$$\hat{H}'(\mathbf{q}) = \sum_{k} \frac{(\hat{p}_k + i)}{2i}$$

$$\langle \mathbf{P} | \phi'_n(\mathbf{q}) \rangle = \phi_n \left(\mathbf{P} + \hbar \mathbf{Q}_1 \right)$$
$$\langle \mathbf{R} | \phi'_n(\mathbf{q}) \rangle = \phi_n(\mathbf{R}) e^{-i\mathbf{Q}_1 \cdot \mathbf{R}}$$

$$\mathbf{Q}_1^T = (\underbrace{q_x, q_y, q_z}_{\text{atom 1}}, \underbrace{0, 0, 0}_{\text{atom 2}}, \dots, \underbrace{0, 0, 0}_{\text{atom N}})$$

From the Brockhouse Nobel lecture (1994): The neutron in being scattered "causes" transitions between the quantum states of the scattering system but does not change the states.

 $\frac{\hbar \mathbf{q} \delta_{1k}}{2m_k}^2 + V\left(\hat{\mathbf{R}}_1, .., \hat{\mathbf{R}}_N\right)$

Select atom 1

Scattering functions

$$F_{s}(\mathbf{q},t) = \frac{1}{Z} \sum_{m,n} e^{-\beta E_{m}} e^{it(E_{n}-E_{m})/\hbar} |a_{m\to n}(\mathbf{q})|^{2},$$

$$S_{s}(\mathbf{q},\omega) = \frac{1}{Z} \sum_{m,n} e^{-\beta E_{m}} |a_{m\to n}(\mathbf{q})|^{2} \delta\left(\omega - [E_{n}-E_{m}]/\hbar\right).$$

Franck-Condon form of the transition amplitudes

$$a_{m\to n}(\mathbf{q}) = \int d^{3N} P \,\tilde{\phi}_n^*(\mathbf{P} + \hbar \mathbf{Q}) \tilde{\phi}_m(\mathbf{P}) = \int d^{3N} R \,\phi_n^*(\mathbf{R}) \phi_m(\mathbf{R}) e^{i\mathbf{Q}_1 \cdot \mathbf{R}}$$

 $E \rightarrow E + \hbar \omega$

Symmetry properties of the transition probabilities

$$w_{m \to n}(\mathbf{q}) \equiv |a_{m \to n}(\mathbf{q})|^2$$

Detailed balance relation etc. fulfilled

$$F_{s}(\mathbf{q}, t) = F_{s}(-\mathbf{q}, -t + i\beta)$$
$$S_{s}(\mathbf{q}, \omega) = e^{\beta\hbar\omega}S_{s}(-\mathbf{q}, -\omega)$$

 $w_{m\to n}(\mathbf{q}) = w_{n\to m}(-\mathbf{q})$

 $(\rho > -1)$

Tauberian theorem

Slowly growing/ varying function

Combined description of elastic and quasi-elastic scattering

$$F(t) = EISF + (1 - EISF)$$

$$S(\omega) = \lim_{\epsilon \to 0} \frac{1}{\pi} \Re \left\{ \hat{F}(i\omega + \epsilon) \right\}$$

$$S_s(\omega) \overset{\omega \to 0}{\sim} \lim_{\epsilon \to 0+} \frac{1}{\pi} \Re \left\{ \frac{F_s(1/(i\omega))}{i\omega + i\omega} \right\}$$

The asymptotic form of the relaxation function for long times time determines the asymptotic form of the dynamic structure factor for small frquencies.

For power law relaxation, the elastic and quasi-elastic lines are fused and the EISF must be adjusted with the parameters describing the relaxation function.

Modeling essentially the asymptotic form of QENS spectra leads to «minimalistic models» describing the form of the spectra with few parameters.

Example: QENS from Phosphoglycerate kinase (A. Stadler)

Towards a quasi-classical picture of energy landscapes

G. R. Kneller and M. Saouessi. Acta Physica Polonica B, 53(2):A-2, 2022.

Relating relaxation rates to the "roughness" of the energy landscape

The distribution barrier heights corresponds to a distribution of rates for kinetic process and conformational relaxation.

$$\lambda = f(\epsilon), \quad \epsilon = \frac{\Delta E}{k_B T} \quad \blacktriangleright \quad p(\lambda) \to \tilde{p}(\epsilon)$$

To relate barrier heights and relaxation rates, one needs a model.

$$\begin{aligned} \lambda &= \lambda_0 e^{-\epsilon} & \text{Arrhenius} \\ \lambda &= \lambda_0 e^{-\epsilon^2} & \text{R. Zwanzig} \end{aligned}$$

g, PNAS 85,1988.

For diffusion in a harmonic potential

$$D_0 = \langle x^2 \rangle \lambda_0$$

$$\lambda = \lambda_0 e^{-\epsilon^2}$$

The widened, softer potential is effectively a doublewell potential. The neutrons see a superposition of the

Work in progress : integrate coherent scattering

$$F(\mathbf{q},t) = \frac{1}{N} \underbrace{\sum_{j,k} \Gamma_{jk} \left\langle e^{-i\mathbf{q}\cdot\hat{\mathbf{R}}_{j}(0)} e^{i\mathbf{q}\cdot\hat{\mathbf{R}}_{k}(t)} \right\rangle}_{f_{jk}(\mathbf{q},t)}$$

$$f_{jk}(\mathbf{q},t) = \frac{1}{Z} \sum_{m,n} e^{-\frac{E_m}{k_B T}} e^{it(E_n - E_m)/\hbar} a_{m \to n}^*(\mathbf{q},j) a_{m \to n}(\mathbf{q},k)$$

$$a_{m\to n}(\mathbf{q},j) = \int d^{3N} P \,\tilde{\phi}_n^* \left(\mathbf{P} + \hbar \mathbf{Q}_j\right) \tilde{\phi}_m(\mathbf{P}) = \int d^{3N} R \,\phi_n^*(\mathbf{R}) \phi_m(\mathbf{R}) e^{\mathrm{i}\mathbf{Q}_j \cdot \mathbf{R}}$$

Interference terms for j ≠ k

Construct analytical and symmetrical relaxation functions

• Find a an even function in time, $f(t) = g(t^2)$, such that $f(t) \stackrel{t \to \infty}{\sim} t^{\alpha}$ and f(0) = 0. Defining $\theta(t) = f(t/\tau_0)(\tau_0/\tau)^{\alpha}$ it follows that

$$\phi(t) = E_{\alpha}(-\theta(t)) \stackrel{t \gg \tau_0}{\sim} E_{\alpha}(-(t/\tau)^{\alpha})$$
 is an anal

- Concrete choice $f(t) = \frac{\Gamma(\frac{\alpha}{2} + \beta)({}_1F_1(-\frac{\alpha}{2};\beta;-t^2)-1)}{\Gamma(\beta)}$ such that $f(t) \stackrel{t \to \infty}{\sim} - \frac{\Gamma(\frac{\alpha}{2} + \beta)}{\Gamma(\beta)} + t^{\alpha} + \frac{e^{-t^2}(-1)^{-\frac{\alpha}{2} - \beta}\Gamma(\frac{\alpha}{2} + \beta)t^{2(-\frac{\alpha}{2} - \beta)}}{\Gamma(-\frac{\alpha}{2})}$. Note that the shift $-\frac{\Gamma\left(\frac{\alpha}{2}+\beta\right)}{\Gamma(\beta)} \to 0$ for $\beta \to 0$.
- Quantum correction: $t^2 \longrightarrow t(t i\beta\hbar)$.

$$;\beta;-t^2\bigr)-1\bigr)$$

Pseudoelastic scattering due to finite resolution

$$S_m(\omega) = (R * S)(\omega) \equiv \int_{-\infty}^{+\infty} d\omega' R(\omega - \omega')$$

$$F_m(\infty) \equiv \int_{-\epsilon}^{+\epsilon} d\omega \, S_m(\omega) \approx F(\infty) + (F_m(0) - F_m(0)) = F_m(0) + F_$$

$$F(\infty) \approx \frac{F_m(\infty) - \xi F_m(0)}{1 - \xi}$$

MBP

Myoglobin

Conclusions

- The Franck-Condon formulation of neutron scattering links the concepts of energy landscapes of complex systems and scattering theory/spectroscopy.
- A quasi-classical interpretation beyond " $\mathbf{h} \rightarrow \mathbf{0}''$ (impactless scattering) is possible and corresponds to diffusion in "rough potentials".
- Coherent inelastic scattering has no classical interpretation and probes correlated wave function-based conformational changes.
- The FC formulation enables a combined description of elastic and quasi-elastic scattering through asymptotic analysis of F(q,t).
- MD simulations are most useful to probe and understand the transition to the asymptotic regime of self-similar protein dynamics in the ps regime.
- "Minimalistic" few parameter for QENS spectra can capture the signature of slight changes in the conformational dynamics of proteins due to external stress.

Integrate the neutron kick into a trajectory-based description of neutron scattering

G. R. Kneller. Inelastic Neutron Scattering from Classical Systems. Mol Phys, 83(1):63-87, 1994.

Propagator form of the intermediate scattering function

$$F_{s}(\mathbf{q},t) = \frac{1}{Z} \int \int \int dx dx' dx'' \\ \underbrace{\langle x|e^{-\beta\hat{H}}|x'\rangle}_{K(x,x',-i\beta\hbar)} \underbrace{\langle x'|e^{it\hat{H}'(\mathbf{q})/\hbar}|x''\rangle}_{K_{q}(x',x'',-t)} \underbrace{\langle x''|e^{-it\hat{H}/\hbar}|x\rangle}_{K(x'',x,t)}$$

Retrieve trajectories through a **path integral representation** of the propagators

Real time propagator

Setting $\Delta t = t/n$

$$\begin{split} \mathcal{K}(x_b, x_a, t) &= \langle x_b | e^{-it\hat{H}/\hbar} | x_a \rangle = \langle x_b | \left(e^{-i\frac{\Delta t}{\hbar}\hat{H}} \right)^n | x_a \rangle \\ &= \int \dots \int dx_1 \dots dx_n \langle x_b | \left(e^{-i\frac{\Delta t}{\hbar}\hat{H}} \right) | x_1 \rangle \langle x_1 | \left(e^{-i\frac{\Delta t}{\hbar}\hat{H}} \right) | x_2 \rangle \dots \\ &\dots \langle x_n | \left(e^{-i\frac{\Delta t}{\hbar}\hat{H}} \right) | x_b \rangle \stackrel{n \to \infty}{\to} \int \mathcal{D}[x(\tau)] e^{iA[x(\tau)]/\hbar} \end{split}$$

Path action integral

$$A[x(\tau)] = \int_0^t d\tau \underbrace{(M\dot{x}(\tau)^2/2 - V(x(\tau)))}_{L(\dot{x}(\tau), x(\tau))}$$

"Kicked" real time propagator

Phase factor form

$$K_q(x_b, x_a, t) = K(x_b, x_a, t)e^{iq(x_b - x_a)}$$

Path integral form

$$K(x_b, x_a, t) = \int \mathcal{D}[x(\tau)]e^{it}$$

"Kicked" path action integral

$$A_q[x(\tau)] = \int_0^t d\tau \underbrace{(M\dot{x}(\tau)^2)}_{t}$$

 $iA_q[x(au)]/\hbar$

Coupling to the neutron $\frac{2}{2} - V(x(\tau) + \hbar q \dot{x}(\tau))$ $L_q(\dot{x}(\tau), x(\tau))$

Imaginary time propagator

Setting
$$t_{th} = \beta \hbar$$
 and $\Delta t_{th} = t_{th}/n$

$$K(x_b, x_a, -i\beta \hbar) = \langle x_b | e^{-\beta \hat{H}} | x_a \rangle = \langle x_b | \left(e^{-\frac{\Delta t_{th}}{\hbar} \hat{H}} \right)^n | x_a \rangle$$

$$= \int \dots \int dx_1 \dots dx_n \langle x_b | \left(e^{-\frac{\Delta t_{th}}{\hbar} \hat{H}} \right) | x_1 \rangle \langle x_1 | \left(e^{-\frac{\Delta t_{th}}{\hbar} \hat{H}} \right) | x_2 \rangle \dots$$

$$\dots \langle x_n | \left(e^{-\frac{\Delta t_{th}}{\hbar} \hat{H}} \right) | x_b \rangle \stackrel{n \to \infty}{\to} \int \mathcal{D}[x(\tau)] e^{-\beta \overline{H}[x(\tau)]/\hbar}$$

Average path energy $\overline{H}[x(\tau)] = \frac{1}{\beta\hbar} \int_0^t d\tau \underbrace{(M\dot{x}(\tau))}_{0} d\tau \underbrace{(M\dot{x}(\tau))}_{0}$

$$\frac{(\tau)^2/2 + V(x(\tau))}{H(\dot{x}(\tau), x(\tau))}$$

 $F_s(\mathbf{q},t) = \frac{1}{Z} \int \int \int dx dx' dx'' K(x,x',-i\beta\hbar) K_q(x',x'',-t) K(x'',x,t)$

forward paths in imaginary time

The red path corresponds to the classical limit, where the total real time action is minimized and the high temperature/short time limit is used for the propagation in imaginary time. The "neutron kick" is taken into account.

Classical limit of the intermediate scattering function

Expressing the density matrix through the classical limit of the Wigner function and retaining only the classical path ($A \gg \hbar$) yields

$$\begin{split} \tilde{F}_{cl}(\mathbf{q},t) &= \frac{1}{Z_{cl}} \int \int d^3p d^3x \, e^{-\beta H(\mathbf{p},\mathbf{x})} e^{-\beta \Delta V(\mathbf{p},\mathbf{x};\hbar\mathbf{q},t)} \\ &\times e^{i\Delta \Phi(\mathbf{p},\mathbf{x};\hbar\mathbf{q},t)/\hbar} e^{i\mathbf{q}\cdot(\mathbf{x}'(\mathbf{p},\mathbf{x},t)-\mathbf{x})} \\ \Delta V(\mathbf{p},\mathbf{x};\hbar\mathbf{q},t) &= V((\mathbf{x}+\mathbf{x}'')/2) - V(\mathbf{x}) \\ \Delta \Phi(\mathbf{p},\mathbf{x};\hbar\mathbf{q},t) &= A(\mathbf{x},\mathbf{x}',t) - A(\mathbf{x}',\mathbf{x}'',t) + (\mathbf{p}_0 + \hbar\mathbf{q}) \cdot (\mathbf{x} - \mathbf{x}'') \\ \end{split}$$
where $\mathbf{x}' \equiv \mathbf{x}'(\mathbf{p},\mathbf{x},t)$ and $\mathbf{x}'' \equiv \mathbf{x}''(\mathbf{p},\mathbf{x};\hbar\mathbf{q},t)$.

The standard classical limit reads

$$\lim_{\hbar \to 0} \tilde{F}_{cl}(\mathbf{q}, t) = \frac{1}{Z_{cl}} \int \int d^3p d^3x \, e^{-\beta H(\mathbf{p}, \mathbf{x})} e^{i\mathbf{q} \cdot (\mathbf{x}'(\mathbf{p}, \mathbf{x}, t) - \mathbf{x})}$$

Outlook – Energy landscape entropy

Based on the probabilistic interpretation of the dynamic structure factor

$$S_s(\mathbf{q},\omega) = \hbar \int dE V$$

one can define a Shannon entropy for the neutron scattering explored energy landscape of proteins

$$H(\mathbf{q}) = -\int_{-\infty}^{+\infty} d\omega$$

 $W_{\mathrm{eq}}(E)W(E+\hbar\omega|E;\mathbf{q}).$

 $S_s(\mathbf{q},\omega)\log(S_s(\mathbf{q},\omega))$

CD analysis (DISCO beam line SOLEIL)

$$\Delta G = 5.10 \text{ kcal/mol}$$

$$\Delta G = 6.05 \text{ kcal/mol} \qquad 70\% D_2O +$$

Classical method of treating global diffusion

$$\frac{1}{\pi} \frac{\sin\left(\frac{\pi\alpha}{2}\right)}{|\omega| \left((|\omega|\tau_R)^{-\alpha} + (|\omega|\tau_R)^{\alpha} + 2\cos\left(\frac{\pi\alpha}{2}\right)\right)}$$

$$\phi_{\rm ML}^{(\epsilon)}(t) = e^{-Dq^2|t|}\phi_{\rm ML}(t)$$

$$\frac{\epsilon \left(\omega^2 + \epsilon^2\right)^{\alpha/2} + \omega \sin(\alpha \arg(\epsilon + i|\omega|)) + \epsilon \cos(\alpha \arg(\epsilon + i|\omega|))}{(\omega^2 + \epsilon^2) \left(((\omega^2 + \epsilon^2)^{\alpha} + 1) (\omega^2 + \epsilon^2)^{-\alpha/2} + 2\cos(\alpha \arg(\epsilon + i|\omega|))\right)}$$

$$\epsilon = Dq^2$$

Setting D = 0 has very little influence on the fit parameters α , τ , EISF.
